

The Unified Astronomy Thesaurus

SLA Annual Conference, All Sciences Poster Session, June 10, 2013. Presented by: Katie Frey

The Unified Astronomy Thesaurus (UAT) is an open, interoperable and community-supported thesaurus that unifies the existing Astronomy & Astrophysics thesauri into a single, freely-available open thesaurus for astronomical objects and concepts.

Why Create a Unified Astronomy Thesaurus?

The main driver behind the creation of a single thesaurus is the wish to support semantic enrichment of the literature, but we anticipate broader use of the UAT (amongst other vocabularies) in data and service discovery applications. We also believe that the UAT will underpin and inspire a new range of cross-system data-sharing applications.

Main Project Goals

- **Open:** Anyone in the community can contribute by suggesting term additions, refinements, and revisions. The thesaurus is released under a Creative Commons license.
- **Interoperable:** The thesaurus is maintained in SKOS and will be exportable in additional file formats.
- **Community-supported:** The UAT is supported by major stakeholders in the astronomical community (including journal publishers, professional societies, and libraries, such as AIP, IoP, IAU, AAS, ADS, and the Wolbach Library).

Data Sources for the Unified Astronomy Thesaurus

The UAT builds upon several pre-existing thesauri, including the IVOA Thesaurus (which evolved from the 1992 IAU Thesaurus), the Physics Astronomy Classification Scheme (PACS), and the astronomy journal keywords. The UAT will be further enhanced and updated through a collaborative effort involving broad community participation. Towards that goal, we have already incorporated the astronomy branch of the SPIE thesaurus.

Fig 1: The UAT unifies terms from multiple thesauri.

The Structure of the Unified Astronomy Thesaurus

Total number of concepts: 1906 | Top-level concepts: 15 | Depth: Seven levels

Fig 2: Representation of the top level terms in the UAT and the corresponding number of child level terms.

The screenshot shows the UAT online browser interface. On the left, a tree view shows the hierarchy: Unified Astronomy Thesaurus > Galactic structure. The main area displays details for 'Galactic structure', including broader terms (Galactic physics), narrower terms (Galactic halo, Galactic pitch angle, Radio cores), use for (Galaxy structure), status (Accepted), term ID (606), and a scope note (See galaxy_structure for generic term (2007-OCT-5: FVH)).

Fig 3: The UAT online browser allows users to navigate the thesaurus hierarchy, beginning with top-level terms. An alphabetical listing of all terms is also available.

Choosing Wisely: UAT System Components

Get Involved!

The thesaurus is currently in a beta stage, while we finalize how the work will be managed and distributed (this will include a SKOS thesaurus). To express your interest in contributing to the UAT or using the UAT for development purposes, join the **Google Group**:

Acknowledgements

The UAT is ultimately based on the 1992 IAU Thesaurus of Shobbrook and Shobbrook, with subsequent additions from Helen Knudsen, Marlene Cummins and Liz Bryson, influence from the consensus list of journal keywords, and, in the late-2000s, updating work by Rick Hessman under the auspices of the IVOA.
